

Romer Labs Launch Long Awaited Rapid Soy Detection Kit

Australasian Medical and Scientific Ltd are pleased to announce the new Romer AgraStrip for Soy is now available. Soy is a very common allergen in foods presenting a problem for children in particular, but also in adults. Soy can be present in many food, beverage and pharmaceutical items due to the common practice of using soy based ingredients and additives.

The AgraStrip for Soy is a significant step forward as it now provides manufacturers and laboratories a fast and simple test to screen for soy in raw ingredients, finished product, and manufacturing environments. No special equipment or laboratory is required to perform the test, and results are available in less than half an hour, making it an ideal tool for on-site testing.

The AgraStrip for Soy offers a high level of sensitivity, with a limit of detection as low as 1ppm, and has been validated with a wide variety of food matrices.
